Instructions for Tracing Using FIMT in ArcGIS 10:

If there is a need to use "trace" to create the fire polygon feature, there is a trick to make it work within the extension. Simply choosing Create Fire Polygon to start your sketch, as was used in old versions of FIMT, will not show the dialog OR create the PerimeterSector feature. The listed steps need to be followed:

1. Select the feature to be traced
2. Click the "Create Fire Polygon" button
3. Create the first vertice by clicking on the map in the beginning location
4. Change the tool to Trace
5. Follow the normal Trace techniques
6. Prior to completing the sketch, user MUST click the "Create Fire Polygon" button again
7. Complete sketch by double-clicking or using the F2 button.

This triggers the attribution box and, apparently, the creation of the PerimeterSector.
